

Reunião de Vendas

Duração **00:14:53** . Consultor **69%** do tempo de palavra . Prospect **31%**

Esta chamada foi processada e analisada duas vezes pelo mesmo modelo de IA: uma vez só com o texto da transcrição, outra vez também com o tom de voz e a expressão facial captados no vídeo. Este relatório mostra, sinal a sinal, o que cada abordagem viu e o que só a segunda conseguiu captar.

Que sinais medimos, e o que significam

Nove sinais de voz, medidos ao longo de toda a chamada. Para cada um: o que significa quando está alto, o que significa quando está baixo, e o que aconteceu nesta chamada em concreto.

SINAL	ALTO SIGNIFICA	BAIXO SIGNIFICA	NESTA CHAMADA
Tom de voz (Pitch Mean)	Voz mais aguda, sinal de entusiasmo ou tensão	Voz mais grave, sinal de calma ou cansaço	0 prospect fala mais agudo que o consultor (266 Hz contra 173 Hz)
Variação do tom (Pitch Std)	O tom sobe e desce muito, sinal de forte envolvimento emocional	O tom fica quase plano, sinal de discurso ensaiado ou desligado	0 prospect varia o tom 4.0x mais que o consultor (80.6 contra 20.0)
Energia da voz (Energy Mean)	Ênfase e entusiasmo, por vezes agressividade	Cansaço ou desinteresse	Energia semelhante nos dois falantes (0.055 consultor,

SINAL	ALTO SIGNIFICA	BAIXO SIGNIFICA	NESTA CHAMADA
			0.050 prospect)
Ritmo de fala (Speech Rate)	Ansiedade ou entusiasmo	Hesitação ou cautela a pensar na resposta	0 consultor fala mais depressa que o prospect (4.2 palavras/seg contra 3.1 palavras/seg)
Pausas entre palavras (Pause Ratio)	Nervosismo, ou simplesmente tempo a pensar	Discurso ensaiado ou dito sob pressão	Pausas semelhantes nos dois (23% consultor, 26% prospect)
Aspereza da voz (ZCR)	Voz mais tensa e agitada	Voz suave e calma	A voz do prospect soa mais tensa que a do consultor (0.157 contra 0.117)
Positividade da voz (Valência)	Concordância genuína	Desconforto ou ceticismo, mesmo quando a pessoa diz que sim	Positividade semelhante nos dois (60% consultor, 54% prospect)
Energia emocional (Arousal)	Envolvido e atento	Desligado, a ouvir por educação	Energia emocional semelhante nos dois (52% consultor, 53% prospect)
Assertividade (Dominance)	Confiante, ou uma objeção	Submisso ou inseguro	Assertividade semelhante nos dois (57%

SINAL	ALTO SIGNIFICA	BAIXO SIGNIFICA	NESTA CHAMADA
	a começar a formar-se		consultor, 58% prospect)
67% ROSTO NEUTRO Está a ouvir, sem confirmar nem negar. É comum numa reunião de descoberta.	23% ROSTO TRISTE Preocupação ou ceticismo, não é raiva. Pede uma pergunta aberta, não uma réplica.	6% ROSTO FELIZ Interesse genuíno e boa receção ao que está a ser dito.	4% ROSTO ZANGADO Uma objeção forte a formar-se, normalmente a volta de perguntas de risco ou preço.
0% ROSTO SURPREENDIDO Reação a algo inesperado. Não ocorreu nesta chamada.	0% ROSTO COM NOJO Rejeição forte a algo que foi dito. Não ocorreu nesta chamada.	0% ROSTO COM MEDO Insegurança aguda. Não ocorreu nesta chamada.	

Como analisamos esta chamada

Os sinais acima vêm de 4 medições independentes sobre o áudio e o vídeo. O LLM (Claude) nunca vê o áudio nem o vídeo, só entra no fim, para interpretar o que já foi medido.

1 - MEDIÇÃO	2 - MEDIÇÃO	3 - MEDIÇÃO	4 - MEDIÇÃO	5 - INTERPRETAÇÃO
Transcrição + Interlocutor 197 segmentos	Prosódia (Tom, Energia, Ritmo) 197 segmentos	Tom de Voz (emoção) 197 leituras	Expressão Facial 90 leituras	Scores + Recomendações só aqui entra o LLM

Os passos 1 a 4 são medições diretas, nunca passam pelo LLM. O LLM só entra no passo 5, para ler os números já medidos e escrever os scores e as recomendações.

HORA	TIPO	SINAL
00:00:07	CONTRADIÇÃO	Prospect says 'Just ran some errands' in a light small-talk tone, but voice valence drops sharply to 0.38 (negative affect territory) — well below the 0.40 threshold — while arousal flattens to

HORA

TIPO

SINAL

0.45. The happy facial expression visible at 00:00:05 has already shifted to neutral. The words are innocuous but the voice signals mild discomfort or low enthusiasm right at the call's open.

Jake missed an early rapport cue. The valence dip at 00:00:07 suggests the prospect was not yet relaxed. A warmer, more personalised opener — referencing something specific from her LinkedIn or the company's recent news — would have warmed the emotional baseline before moving to the agenda at 00:00:12.

00:00:17

CONTRADIÇÃO

Prospect says 'Yes' (confirming the 10-minute schedule) but her voice valence is only 0.46 and facial scores show meaningful angry (0.17) and sad (0.18) components with neutral dominant at 0.48 — a notably mixed affect. The verbal agreement masks underlying reticence or impatience.

This mixed signal at the very start of the substantive call suggests the prospect may have felt the time-check question was unnecessary admin. Jake should have skipped the schedule confirmation and moved directly to value. If a time-check is needed, pair it with an immediate payoff statement: 'I know we only have 10 minutes — here's exactly what I want you to walk away with.'

00:00:34

CONTRADIÇÃO

Jake asks his first discovery question about 18-month growth projections. His facial emotion shifts to angry-dominant (0.37 angry, 0.22 sad, 0.36 neutral) while his voice remains moderate (valence 0.59). The prospect's face also shifts to angry-dominant in this same window. This shared negative affect spike at the first real discovery question is unusual and suggests the framing of the question may have felt interrogative or pressuring rather than collaborative.

Reframe growth-projection questions as curiosity-led rather than interrogation-style. Instead of 'could you tell me about the growth you're projecting,' try 'I'd love to understand what success looks like for you this year — what does growth mean for your

HORA	TIPO	SINAL
		team?' The softer frame lowers dominance signals from both parties.
00:01:57	SINAL DE COMPRA	Prospect voice valence drops to 0.34 (negative) as she says 'it is a lot of responsibility leading all of the employees below me.' This is the first genuine pain articulation. She is signalling stress about the weight of the CIO role, which is the perfect hook for Gartner's executive partner value proposition. Jake responded with a generic 'Definitely' (00:02:06, valence 0.55, flat arousal 0.38). He should have reflected the emotion and deepened the pain: 'That weight of responsibility — when you think about making a tech decision that affects the whole organisation, what keeps you up at night?' This would have opened the door to a much richer discovery conversation.
00:02:19	CONTRADIÇÃO	Prospect says 'Not necessarily, pretty open, but nothing that comes to mind right now' — seemingly low-resistance language. But voice valence is 0.44 (borderline negative), arousal a moderate 0.50, and facial angry scores are elevated (0.13). She is not as open as her words suggest; she may simply lack context to articulate a need, or she is mildly guarded. Jake moved on too quickly (00:02:26 'All right'). A low valence 'open' answer is an invitation to probe with a different angle, not to pivot. Try: 'A lot of new CIOs I talk to tell me the hardest part isn't the tech — it's knowing which decisions to prioritise. Does that resonate at all?' This uses social proof to make it safe for her to surface a need.
00:03:21	RISCO/OBJEÇÃO	Jake asks the prospect to imagine making a poor decision (00:03:21-00:03:40). The prospect's facial emotion spikes to angry-dominant at 55% angry, 15% sad (00:03:21), and remains at 45% angry at 00:03:40. Jake's own voice valence drops to 0.40 and 0.39 across this window. Meanwhile, the prospect's verbal answer at 00:03:43 — 'I haven't gotten to that point yet, but I'm assuming it would be bad' — is delivered with valence of only 0.30

HORA	TIPO	SINAL
		(strongly negative) while her face shows happy at 88%. This is a classic defensive happy mask over genuine discomfort. The fear-of-loss framing triggered visible irritation (angry face) before the prospect even answered. For a prospect who is new to her role and still building confidence, asking 'what would happen if you made a poor decision' is perceived as an attack on her competence. Replace this with an aspiration frame: 'What would it mean for your career and your team if you absolutely nailed the technology decisions in year one?' The happy facial mask at 00:03:43 signals she was socially managing the moment, not genuinely engaging — a warning sign Jake did not read.
00:04:26	SINAL DE COMPRA	Prospect explicitly states she makes technology decisions but the CFO must approve pricing. Voice valence is 0.60, arousal 0.57, dominance rising to 0.61 — she is assertive and clear. This is a high-quality qualification signal: the prospect is a champion, not the economic buyer. Jake acknowledged this (00:04:46) but did not immediately pivot to planning CFO inclusion. He should have said here: 'That makes total sense. If it's helpful, I've done joint calls before where I walk the CFO through the ROI math directly — would it be useful to get him on our next call so he hears it firsthand?' Planting this seed at 00:04:26 rather than at 14:11 would have shortened the sales cycle.
00:05:09	CONTRADIÇÃO	Prospect answers 'Pretty much just him' (CFO is the only other stakeholder) with voice valence crashing to 0.23 — the lowest point in the entire meeting — while arousal spikes to 0.65 and dominance to 0.67. The very short, clipped answer paired with strongly negative affect and rising dominance suggests this line of questioning about her network felt intrusive or condescending. Jake's extended probing about mentors and networks (00:02:31-00:03:00) inadvertently implied the prospect lacked adequate support — which for a newer CIO is a sensitive topic. The

HORA**TIPO****SINAL**

negative valence at 00:05:09 is a residual signal from that section. Jake should have pivoted to solution framing much sooner, positioning Gartner's executive partner as an enhancement rather than a remedy for a deficit.

00:09:00

RISCO/OBJEÇÃO

The prospect's sharpest objection of the meeting: 'If these executives aren't part of my internal team, how can I trust them to give me quality value advice? They don't know what I am doing... they don't know anything about my company.' Voice valence is 0.46, arousal 0.47, dominance 0.57 — measured and deliberate. Facial sad is dominant (52%) at 00:08:30 leading into this, suggesting the extended executive-partner pitch (00:07:59-00:08:54) was eroding rather than building confidence. Jake's response (00:09:24) was good directionally — he used Gartner's industry-matching methodology and network depth — but he led with 'That's a great question,' which is a filler that sophisticated buyers notice. More importantly, he should have used a third-party proof point: 'I have a CIO client in a similar growth-stage company who said the same thing before they met their partner — would it help if I set up a 15-minute intro call with one of our CIOs so you can evaluate the fit yourself before committing?' A live proof call would directly address the trust gap.

00:10:36

CONTRADIÇÃO

Prospect says 'Sure' to learning about budget tools. But the facial emotion is the strongest sad score in the meeting: 77.6% sad (00:10:36). Voice valence is 0.64, arousal 0.63 — she is verbally compliant but emotionally disengaged or fatigued. This is a surface-level yes masking a checked-out state.

At 10:36, the prospect has been talked at through a slide deck, an executive partner pitch, and is now being walked into a budget-tool section. Jake needed to pause and re-qualify: 'Before I go further, I want to make sure this is the most useful use of your time — on a scale of 1 to 10, how relevant does this feel to your current priorities?' Re-engaging her voice resets emotional investment

HORA	TIPO	SINAL
		and prevents the passive compliance that kills follow-up momentum.
00:12:23	CONTRADIÇÃO	Prospect says 'No, it looks great' about the IT budget tool with strong voice valence (0.85) — her highest positive verbal signal of the meeting. Yet the facial sad score is 97.1% at this exact moment (00:12:17-00:12:23). This is the starkest dissonance in the entire recording: extremely positive words, extremely negative face. This signal indicates the prospect is performing positivity — likely to move the meeting along — while actually feeling disengaged or unconvinced. Jake celebrated this with 'Okay, well, awesome' (valence 0.96, his own most exuberant moment) and immediately pivoted to price, completely missing the warning. He should have paused: 'I want to make sure this is genuinely resonating and not just me showing you slides — what part of this do you see yourself actually using?' Surface the real sentiment before advancing to price.
00:13:50	SINAL DE COMPRA	Prospect proactively asks: 'If my CFO doesn't agree with the price, are you guys willing to negotiate with us?' Voice valence drops to 0.29 (strongly negative) — her concern is real. This is a genuine commercial engagement signal, not just politeness. She is already mentally simulating the CFO conversation. Jake's response was overly hedging ('I wouldn't want to make any guarantees, but we would bring some of our engineers...'). For a prospect who just agreed to bring her CFO to the next call, this hedging introduces uncertainty at the worst moment. A stronger close: 'Absolutely — that's exactly why I want the CFO on the call. I'll come prepared with a tailored ROI model based on your \$1.5M IT spend so we're speaking his language from minute one. Does that work?' This commits Jake to preparation and gives the prospect confidence to champion Gartner internally.
00:14:22	FECHO	Prospect agrees to add CFO to the next call: 'Yeah, I'll see what their calendar looks like, and

HORA

TIPO

SINAL

then I'll add them to our call.' Voice valence 0.54, arousal 0.52, dominance 0.53 — neutral-positive, calm. Facial is neutral (97.6%). This is a genuine but soft commitment — she is not resisting, but she has not confirmed a date.

Jake said 'I'll send you over an invite' without locking a specific time. At 00:14:17, he named 'next Monday' but did not get a confirmed day/time. He should have closed on the spot: 'Great — I have Monday at 10am or 2pm open. Which works better for you, and what's the best way to reach your CFO so I can include him directly on the invite?' Getting the CFO's contact details in this call would have dramatically increased show rate and deal velocity.

Recomendações

STOP using fear-of-loss framing with this prospect. The angry-face spike at 00:03:21–00:03:40 and the defensive happy-mask response at 00:03:43 (valence 0.30, face 88% happy) show she reacts to competence-threatening questions with visible irritation and then polished deflection. Reframe every risk question as an aspiration: 'What does a great year-one look like for you?' rather than 'What happens if you make a bad decision?'

Read the sad-face/positive-word dissonance pattern — it appeared three times (00:10:36 at 77.6% sad with verbal 'Sure'; 00:12:23 at 97.1% sad with verbal 'it looks great'; 00:14:27 with sad-dominant face while Jake expressed peak enthusiasm). Each time Jake accelerated instead of pausing. Build in one genuine temperature-check question after each major section: 'Before I keep going — what's actually landing for you here?'

Introduce the CFO inclusion strategy at 00:04:26, not 00:14:11. The prospect flagged CFO budget authority clearly and with rising dominance (0.61) mid-meeting. A ten-minute delay in addressing the economic buyer means the entire budget and pricing section (00:10:39–00:13:00) was delivered to someone who cannot say yes. Next time: 'Let's make sure we're not wasting your time — can we get your CFO on the next call so I can speak to the financial ROI directly?'

Lock the next meeting to a specific date and time before hanging up. At 00:14:17 Jake named 'next Monday' but left the calendar outcome as 'I'll see what their calendar looks like.' The prospect's valence at close was only 0.54 — tepid. A specific confirmed slot (day + time + CFO contact) raises commitment level and

reduces no-show risk. Use the alternative close: 'Monday 10am or 2pm — which is better for you?'

Use a third-party proof call to resolve the executive-partner trust objection raised at 00:09:00. Jake's verbal rebuttal (industry matching, network depth) was factually correct but the prospect's subsequent 'Yeah, sounds good' at 00:10:20 arrived with a 43% sad facial score — she was not truly convinced. Offer a 15-minute intro call with an actual Gartner CIO executive partner before the next formal meeting. Reducing perceived risk with a live sample is far more persuasive than describing the matching process.

Anchor the ROI calculation to the prospect's specific \$1.5M IT expenditure figure (which Jake correctly cited at 00:10:58) in every future communication. The '\$200,000 in savings' number is the strongest concrete value statement in the meeting, but it came 11 minutes in after a sustained sad-face pattern. Lead with this number in the follow-up email and open the CFO call with it — it is the CFO's language, not the CIO's.

Reduce filler affirmations ('Wonderful,' 'Definitely,' 'Okay, great') — Jake used these 12+ times. His own voice valence on these words frequently spiked to 1.0 (00:00:18, 00:00:33, 00:12:25) while the prospect's face showed sad or neutral. This emotional mismatch signals to sophisticated buyers that enthusiasm is performative. Replace filler affirmations with reflective statements that show you heard the specific thing the prospect just said.

WhisperX . pyannote . librosa . audeering wav2vec2 . DeepFace . Claude
